

PIGGY BANK PET

(Working Title)

Product Requirements Document & Master Prompt Guide

Prepared for: Antigravity Studio

Version 1.0 | May 2026

Project Name	Piggy Bank Pet (Name TBD)
Platform	Mobile — iOS & Android (React Native / Flutter recommended)
Target Market	Filipino young adults, students, working professionals
Core Loop	Log expenses → Feed/maintain your pig → Grow your farm
Art Style	Retro pixel / chiptune aesthetic (in development)
Pig Characters	Custom illustrated sprites (in development by art team)
Status	Pre-development — PRD & Prompt Guide for AI-assisted builds
Document Owner	Product Team

1. Product Overview

Piggy Bank Pet is a retro-styled mobile budget tracker that gamifies personal finance through a virtual pig companion. Users manage their real-world spending and savings while nurturing a pixel-art pig whose health, mood, and appearance directly reflect the user's financial discipline. The app blends practical financial tools with social features, collectibles, and consequence-driven gameplay to create long-term engagement.

1.1 Core Design Philosophy

- Money saved = food for your pig — spending under budget directly feeds and grows the pig
- Overspending has visible consequences — the pig visually deteriorates when the user goes over budget
- Social accountability — a Pig Farm lets users compare progress with friends
- Low friction logging — receipt scanning, AI chat logging, and recurring expense automation reduce manual entry
- Retro charm — pixel art, chiptune UI sounds, and arcade-style reward loops create nostalgia and delight

1.2 Primary User Goals

- Track daily spending across multiple accounts (GCash, bank, cash)
 - Stay within a monthly budget and build savings habits
 - Manage debts — both money owed to them and money they owe others
 - Automate recurring expenses so they never forget subscriptions or bills
 - Have fun doing it — the pig makes finance feel like a game, not a chore
-

2. User Accounts & Authentication

Cross-device sync — users should never lose their pig

2.1 Authentication Methods

- Email + password registration
- Google Sign-In (OAuth 2.0)
- Apple Sign-In (required for iOS App Store)
- Facebook Login (optional, for social/friend features)

2.2 Account Data & Sync

- All user data — expenses, pig state, wallet balances, friends, achievements — syncs to the cloud in real time
- Users can log into multiple devices and see the same state
- Offline mode: local caching allows expense logging without internet; syncs when reconnected
- Data export: users can request a CSV export of all their transaction history

Pig state must be server-authoritative to prevent cheating on the leaderboard

MASTER PROMPT — Authentication Module

Build a cross-platform mobile authentication system for a retro-themed budgeting app called Piggy Bank Pet.

Requirements:

- Support Email/Password, Google OAuth, Apple Sign-In (iOS mandatory), and optional Facebook Login.
- Use a cloud backend (Firebase Auth or Supabase Auth) so all user data persists across devices.
- On first login, trigger an onboarding flow: set monthly budget, choose home currency (PHP default), create first wallet.
- Implement offline-first architecture: queue expense logs locally (SQLite or AsyncStorage) and sync on reconnect.
- All pig state and leaderboard data must be server-authoritative. Never trust client-only state for these.
- UI must match a retro pixel-art aesthetic with pixel fonts and a dark purple (#1A0A2E) background.
- After auth, route to the Home Dashboard (pig + today's spending summary).

3. Multi-Wallet Account System

Track money across GCash, bank, and cash in one place

3.1 Wallet Types

E-Wallet Accounts

- GCash, Maya (PayMaya), ShopeePay, GrabPay, and other Philippine e-wallets
- User enters the account name and sets a starting balance
- Each wallet has a unique pixel-art icon (retro bank card / phone icon)

Bank Accounts

- BDO, BPI, UnionBank, Metrobank, Security Bank, and others
- User can link by manual balance entry (Phase 1) or via Open Finance API if available (Phase 2)
- Separate running balance per bank account

Cash

- A dedicated 'cash on hand' wallet
- User manually updates balance when they withdraw or receive cash
- Displayed as a pixel-art coin pouch

3.2 Wallet Features

- Users can create unlimited wallets with custom names and icons
- Each expense log is tagged to a specific wallet — reduces balance accordingly
- Transfer between wallets (e.g., GCash to Cash) is logged as a neutral transfer, not an expense
- Dashboard shows total net worth across all wallets at a glance
- Each wallet shows its own transaction history with filter/search

MASTER PROMPT — Multi-Wallet System

Build the multi-wallet module for Piggy Bank Pet, a retro-styled mobile budgeting app.

Requirements:

- Users can create multiple wallets: E-Wallet (GCash, Maya, etc.), Bank (BDO, BPI, etc.), and Cash.
- Each wallet stores: name, type, current balance, currency (PHP default), icon (retro pixel style), and color tag.
- Wallet balances update in real time when an expense or income is logged against them.
- Support wallet-to-wallet transfers that do not count as an expense or income (neutral transfer).
- Home dashboard aggregates all wallet balances into a total net worth figure.

- Each wallet has its own transaction history screen with date filter, category filter, and search.
- UI: retro pixel card layout, dark purple background, neon pink (#E91E8C) accents, pixel font for balance numbers.
- Store wallet data in cloud DB (Firestore or Supabase) linked to user account for cross-device sync.

4. Expense Logging System

The core financial engine — multiple ways to log, zero friction

4.1 Manual Expense Entry

- Fields: Amount, Category, Wallet used, Date/Time, Description (optional), Photo (optional)
- Quick-add button always visible on bottom nav — one tap to log
- Recent categories and amounts surfaced for fast repeat logging
- Support both expense and income entries

📝 The quick-add sheet should open from the bottom and be dismissible — modeled after Splitwise or Notion mobile entry

4.2 Expense Categories

Default categories (each with a retro pixel icon):

- 🍔 Food & Drinks
- 🚗 Transport
- 🏠 Utilities
- 📖 Education
- 🛒 Shopping
- 🏥 Health & Medical
- 🎮 Entertainment
- 💳 Debt Payment
- 📰 Subscriptions
- 💼 Salary / Income
- + Other (user-defined)

Users can create and name their own custom categories with emoji selection.

4.3 Receipt Scanner

Camera-Based OCR Scanning

- User taps 'Scan Receipt' to open the camera
- App captures image and runs OCR (Google ML Kit Vision or AWS Textract)
- Auto-detects: merchant name, total amount, itemized line items, date
- User reviews extracted data on a confirmation screen before saving
- Unrecognized fields are left blank for manual completion
- Supports both physical receipts and digital receipt screenshots

📝 If OCR confidence is below threshold, prompt user to manually confirm each field

4.4 AI Chat Logging (Conversational Input)

Natural Language Expense Entry

- A persistent chat bubble / input bar on the Home screen
- User types a natural language expense description
- AI parses and extracts: amount, category, wallet, and date
- Parsed data is shown in a confirmation card before being saved
- Supports Filipino/Taglish input alongside English

Example inputs the AI should correctly parse:

- 'Spend 400 on milktea using GCash today' → ₱400 | Food & Drinks | GCash | Today
- 'Bayad ng Grab 150 kanina' → ₱150 | Transport | infer wallet | Today
- 'Nagbayad ako ng Netflix 549 BDO' → ₱549 | Subscriptions | BDO | Today
- 'Natanggap 5000 sahod sa BPI' → ₱5,000 income | BPI | Today

MASTER PROMPT — Expense Logging + AI Chat Parser

Build the expense logging module for Piggy Bank Pet. This must include:

A. MANUAL ENTRY: A bottom-sheet quick-add form with: amount (numpad), category picker (horizontal scroll with pixel icons), wallet selector, date picker (defaults today), optional notes field. Auto-save on confirm.

B. RECEIPT SCANNER: Integrate Google ML Kit Text Recognition (or Tesseract.js for web). Open camera, capture image, extract total amount + merchant + date via OCR. Show editable confirmation screen before saving.

C. AI CHAT LOGGER: A persistent chat input bar on the home screen. Send user text to a language model (Claude Haiku or GPT-3.5-turbo). System prompt: 'You are a budgeting assistant. Extract from the user message: amount (number), category (one of: Food, Transport, Utilities, Education, Shopping, Health, Entertainment, Debt, Subscriptions, Income, Other), wallet name (match to user's wallets), date (default today). Reply ONLY with valid JSON: {amount, category, wallet, date, description}. Support Filipino/Taglish input.' Show confirmation card with parsed data. User taps Confirm to save.

D. CATEGORIES: Default set + user-created custom categories with emoji. Each expense is tagged with exactly one category.

All expenses are saved to the cloud, linked to user account, and update wallet balance in real time. Saving an expense must also trigger the pig feeding calculation (see Pig System section).

5. Budget & Savings System

The money saved becomes food for your pig

5.1 Monthly Budget Setup

- User sets a total monthly spending budget (in PHP by default)
- Optionally set sub-budgets per category (e.g., ₱3,000 for Food, ₱500 for Entertainment)
- Dashboard shows a retro progress bar — budget used vs. remaining
- Budget resets automatically at the start of each calendar month
- Users are notified 3 days before month-end if they are on track to overspend

5.2 Savings Calculation & Pig Feeding

- At the end of each day, the app calculates: $\text{Remaining Budget} \div \text{Days Left in Month} = \text{Daily Budget}$
- If the user spent less than their daily budget, the surplus = food for the pig (shown in pixel food units)
- Larger savings = more food = pig grows bigger and happier
- A progress bar on the home screen shows today's spending vs. daily budget allocation
- The percentage saved is visually mapped to the pig's fullness meter

 *Food units are a UI metaphor — the actual savings amount in PHP is always shown alongside*

5.3 Budget Warning States

75% of budget used	Pig looks slightly worried — amber warning color on progress bar
90% of budget used	Pig looks sad — red warning on bar — push notification triggered
100% (on-budget day)	No food for pig today — pig stomach growls animation
Over budget 1 day	Pig becomes grumpy — facial expression changes
Over budget 2 days	Pig becomes visually thin / gaunt — health bar drops
Over budget 3 days	Pig leaves — you must start with a new pig
1 week under budget	Reward: a new pig is added to your farm

MASTER PROMPT — Budget Engine & Pig State Calculator

Build the budget and pig state system for Piggy Bank Pet.

BUDGET ENGINE:

- User sets monthly budget total and optional per-category limits.
- $\text{Daily budget} = (\text{monthly budget} - \text{amount spent so far this month}) / \text{days remaining in month}$.
- At end of day (midnight local time), calculate surplus or deficit vs. daily budget.
- Surplus feeds the pig (positive food delta). Deficit triggers a warning state.

PIG STATE MACHINE: Implement a state machine with these states and transition rules:

- HAPPY: spending under budget, fed today
- WORRIED: within 75–90% of monthly budget
- SAD: over 90% of monthly budget OR missed logging for 1 day
- GRUMPY: 1 consecutive day of overspending
- SKINNY: 2 consecutive days of overspending
- GONE: 3 consecutive days of overspending (pig removed, new pig flow triggered)
- FULL/GLOWING: saved 20%+ of daily budget (pig visually happy + sparkle animation)

Store consecutive_overbudget_days and last_log_date per user in cloud DB.

Trigger state recalculation nightly via a cloud function / cron job.

Push notifications must fire for: SAD state, SKINNY state, and GONE state.

Expose pig state as a reactive value so all UI screens can read and react to it.

6. Recurring Expense Automation

Set it once, never forget it again

6.1 Recurring Expense Setup

- User creates a recurring expense template: name, amount, category, wallet, frequency
- Frequency options: Daily, Weekly, Bi-weekly, Monthly, Annually
- Option to set an exact date for monthly billing (e.g., every 5th of the month)
- Examples: Netflix ₱549/month, PLDT ₱1,299/month, Gym ₱1,500/month

6.2 Automatic Logging

- On the billing date, the expense is automatically added to the user's log without manual entry
- A push notification confirms: 'Netflix ₱549 has been automatically logged from GCash'
- User can edit or delete individual auto-logged entries if the actual amount differed
- Recurring expenses are visually tagged with a loop icon in the transaction list

6.3 Recurring Expense Management

- Dedicated 'Recurring' screen showing all templates, next billing dates, and monthly total
- Users can pause, edit, or delete any recurring template
- Monthly recurring total is shown on the budget planning screen for awareness

 *Auto-logged recurring expenses count toward the pig state calculation the same as manual entries*

MASTER PROMPT — Recurring Expenses Module

Build the recurring expenses module for Piggy Bank Pet.

Requirements:

- CRUD for expense templates: name, amount, category, source wallet, frequency (daily/weekly/biweekly/monthly/annually), billing day (for monthly, day 1–28).
- A cloud-side scheduler (Firebase Cloud Functions cron or Supabase Edge Functions) checks daily for due recurring expenses.
- When due, auto-create an expense log entry identical to manual entries, tagged as 'recurring'.
- Send a push notification to the user confirming auto-log: '{name} ₱{amount} auto-logged.'
- Recurring expenses update wallet balance and pig state just like manual entries.
- Dedicated management screen: list all templates, show next due date, monthly total, pause/edit/delete controls.
- If a recurring expense falls on a day the user is already over-budget, still log it but flag it clearly.

7. Debt Tracker

Who owes who — keep it clear, keep it friendly

7.1 Debt Types

- Money others owe YOU (receivable) — e.g., a friend borrowed ₱500
- Money YOU owe others (payable) — e.g., you owe a friend for lunch

7.2 Debt Record Fields

- Person's name (can link to in-app friends)
- Amount in PHP
- Description / reason
- Date borrowed / lent
- Due date (optional)
- Partially paid tracking — mark partial payments against the debt
- Status: Active, Partially Paid, Fully Settled

7.3 Debt Features

- Separate tabs: 'They Owe Me' and 'I Owe Them'
- Net debt summary at the top (total owed to you minus total you owe)
- Reminder notification as due date approaches (3 days before, 1 day before, on the day)
- When marked as settled, the amount is optionally logged as income (they paid you back) or expense (you paid them)
- Soft social nudge: option to send a reminder message via native share sheet

 *Do not implement bank/payment integration for debt — this is record-keeping only, not a lending platform*

MASTER PROMPT — Debt Tracker Module

Build the debt tracker screen for Piggy Bank Pet.

Requirements:

- Two sections: 'They Owe Me' (receivables) and 'I Owe Them' (payables), shown as tabbed lists.
- Each debt record: person name, amount, description, date created, optional due date, partial payments log, status (active / partial / settled).
- Net summary card at top: total receivable minus total payable.
- Partial payment flow: user marks a partial payment, amount is subtracted from remaining balance.
- Settled debts: user can optionally post the settlement as an income entry (for receivables) or expense entry (for payables) into the main log.
- Due date reminders: push notifications 3 days before, 1 day before, and on due date.
- 'Nudge' button: opens native share sheet with a pre-filled friendly message to the debtor.
- UI: retro card layout, separate color coding for receivables (green tint) and payables (red tint).
- All debt data is cloud-synced and linked to the user's account.

8. Pig Companion System

Your pig is a living reflection of your financial health

8.1 Pig States & Visual Design

Note to art team: All pig states below require unique sprite animations. The following are behavioral specifications; final visual design is in the art team's hands.

HAPPY	Default state — content pig, idle animation, occasional oink
FULL / GLOWING	Saved 20%+ of daily budget — pig has sparkles, big smile
WORRIED	75–90% of budget used — pig fidgets, looks at wallet nervously
SAD	90%+ of budget OR missed a log day — pig droops, raindrop animation
GRUMPY	1 day over budget — pig has angry eyebrows, stomps foot
SKINNY	2 days over budget — pig is visually thinner, ribs show subtly
GONE	3 days over budget — pig waves goodbye and leaves the pen
SLEEPING	Night time (10 PM – 7 AM) — pig sleeps in a pixelated bed

8.2 Pig Cosmetics

- Pigs can wear hats, accessories, backgrounds, and pen decorations
- Cosmetics are unlocked via the shop (purchased with coins) or earned via milestones
- Each cosmetic item has a rarity: Common, Rare, Epic, Legendary
- Equipped cosmetics persist visually even when pig state changes (e.g., sad pig still wears its hat)

 *All cosmetic items are purely visual — they confer no financial advantage*

8.3 Pig Farm & New Pig Rewards

- Users start with one pig in their farm
- Completing 1 full week under budget rewards the user with a new pig
- Each pig in the farm is independent — its own name, cosmetics, and state
- The farm screen shows all pigs in pixel-art pens, tappable to inspect each
- Maximum farm size: 10 pigs (to encourage long-term play)
- Different pig types/breeds can be unlocked — e.g., Black Pig, Spotted Pig, Golden Pig

MASTER PROMPT — Pig System & Farm UI

Build the pig companion system and farm screen for Piggy Bank Pet.

PIG MODEL (per pig):

```
{ id, name, breed, state: 'happy|full|worried|sad|grumpy|skinny|gone', health: 0–100,  
  foodLevel: 0–100, cosmetics: {hat, accessory, background, pen}, dateAcquired, isActive }
```

HOME SCREEN PIG:

- Display the active pig with its current state animation (sprite sheet / Lottie).
- Show a food meter (pixel-art food bowl with fill level) and a mood indicator.
- Tapping the pig plays a random idle sound and a small interaction animation.
- Today's savings percentage maps to food level: 0% saved = 0 food, 20%+ saved = full.

FARM SCREEN:

- Grid of pixel-art pig pens, one per owned pig.
- Each pen shows the pig's name, current state icon, and equipped cosmetics.
- Locked pen slots show a padlock with '7-day streak required'.
- Tapping a pen navigates to that pig's detail screen.
- New pig reward flow: confetti animation + pig naming modal + farm pen unlocks.

COSMETICS: Implement equip/unequip for hat, accessory, background, and pen decoration slots. Cosmetics are stored per-pig and rendered as sprite overlays.

9. Gamification & Rewards System

Streaks, coins, cosmetics, and the leaderboard

9.1 Coin Economy

- Coins are the in-app currency, earned through gameplay — never purchasable with real money
- Coins are spent in the Cosmetics Shop
- Coin sources:
 - Daily login: +5 coins
 - Logging an expense: +2 coins
 - Staying under budget for the day: +10 coins
 - Streak milestones (see below): bonus coins
 - Completing financial goals: +50 coins
- Coin balance is displayed in the top navigation bar with a pixel coin icon

9.2 Streak System

A streak is defined as consecutive days of: (a) logging at least one expense AND (b) not going over budget.

3-day streak	+20 bonus coins — 'Thrifty Start' badge
7-day streak	+50 bonus coins — unlock: Spotted Pig breed + new pig slot
14-day streak	+100 bonus coins — unlock: Rare accessory cosmetic
30-day streak	+250 bonus coins — unlock: Golden Pig legendary breed
60-day streak	+500 bonus coins — unlock: Legendary background set
Streak broken	Reset to 0 — push notification: 'Your streak broke! Get back on track.'

9.3 Cosmetics Shop

- Categories: Hats, Accessories, Backgrounds, Pen Decorations, Pig Breeds
- Each item has a coin price, rarity tier, and a pixel-art preview
- Items can be previewed on your current pig before purchasing
- Seasonal / limited-time items appear for special events (e.g., Christmas, New Year)
- Purchased items go to the user's inventory — they persist permanently

9.4 Leaderboard (Pig Farm Friends)

- Users can add friends via username or share link

- The leaderboard ranks friends by: total days under budget this month
- Secondary ranking: longest current streak
- Users can see their friends' pig states (but not their actual spending amounts — privacy first)
- Global leaderboard: top 100 users by streak length, opt-in only

 *Never show actual peso amounts on the leaderboard — only behavioral metrics (streak, days under budget)*

MASTER PROMPT — Gamification, Coins & Shop

Build the gamification layer for Piggy Bank Pet: coins, streaks, shop, and leaderboard.

COIN ENGINE:

- Track user coin balance in cloud DB. Award coins on: daily login (+5), expense logged (+2), day under budget (+10), streak milestones (variable).
- All coin awards are idempotent per day — cannot be earned twice in one day.
- Display coin balance in top nav with a pixel coin icon and a +N award animation on earn.

STREAK ENGINE:

- Streak = consecutive days with at least 1 expense logged AND total spending under daily budget.
- Cloud function at midnight checks each user's streak. If either condition fails, reset streak to 0.
- On streak milestone (3, 7, 14, 30, 60 days), trigger: bonus coins, unlock reward, push notification, modal celebration.

COSMETICS SHOP:

- Catalog of items with: id, name, category (hat/accessory/background/pen/breed), price (coins), rarity, image asset.
- Preview mode: temporarily apply cosmetic to pig on shop item page.
- Purchase flow: confirm dialog → deduct coins → add to inventory → equip prompt.
- Purchased items stored in user's inventory, never expire.

LEADERBOARD:

- Friend system: add via username search or shareable link.
- Leaderboard metric: days under budget this calendar month (primary), streak (secondary).
- Show friend's pig state icon and username only — never show actual spending amounts.
- Opt-in global leaderboard for top streaks.
- Update leaderboard rankings daily via cloud function.

10. Notification System

Timely nudges that keep the pig fed and the budget intact

10.1 Notification Types

Daily Logging Reminder	If no expense logged by 8 PM → 'Hey! Don't forget to log today's expenses 🐷'
Budget Warning (90%)	When 90% of monthly budget is used → 'Watch out! Your pig is getting worried 😬'
Pig State Change	When pig transitions to SAD, GRUMPY, SKINNY, or GONE state
Streak Milestone	When user hits a streak milestone → celebration notification with reward summary
Streak Broken	'Your streak broke! Log today and start a new one 🐷'
Recurring Expense Auto-Logged	'{Name} ₪{amount} has been automatically logged from {wallet}'
Debt Due Reminder	3 days before, 1 day before, and on due date for active debts
New Pig Reward	'You earned a new pig! 🐷 Go to your farm to name it.'
Monthly Budget Reset	First day of month → 'New month, new budget! Update your goal 🐷'

10.2 Notification Settings

- Users can toggle each notification type on/off individually
- Users can set their preferred daily reminder time (default: 8 PM)
- Notification preferences are synced across devices
- Quiet hours: users can set a do-not-disturb window (e.g., 10 PM – 7 AM)

MASTER PROMPT — Push Notification System

Build the push notification system for Piggy Bank Pet using Firebase Cloud Messaging (FCM).

NOTIFICATION TRIGGERS (all server-side via cloud functions/cron):

- Daily reminder: At user's set time (default 8 PM local), check if any expense was logged today. If not, send reminder.
- Budget warning: Whenever a new expense is logged and cumulative monthly spending crosses 90%, send warning.
- Pig state change: Send notification whenever pig state transitions to SAD, GRUMPY, SKINNY, or GONE.
- Streak milestone: On streak milestone achievement, send celebration notification.
- Debt due: 3 days before, 1 day before, on due date for any active debt records.
- Recurring auto-log: After successfully auto-logging a recurring expense, send confirmation.

- Monthly reset: First of each month at 6 AM local time.

CLIENT REQUIREMENTS:

- Notification settings screen: toggle per notification type, daily reminder time picker, quiet hours range.
- Store FCM token per device, refresh on app open.
- Deep link from notification to relevant screen (e.g., debt notification → Debt Tracker).
- Retro notification icon: pixel pig silhouette.

11. Home Dashboard

The heart of the app — pig, budget, and today at a glance

11.1 Dashboard Components

- Animated pixel-art pig in its current state (center stage)
- Greeting header: 'Good morning, [name]! 🐷' with current date
- Today's spending: ₪X spent out of ₪Y daily budget — retro progress bar
- Monthly budget summary: ₪X remaining of ₪Y monthly budget
- Quick-add expense button (always visible, floating or bottom bar)
- AI chat input bar: 'Tell me what you spent...' placeholder
- Recent transactions: last 5 entries with category icon, amount, wallet
- Streak counter: 📅 N days — tappable to view streak history
- Coin balance: shown in top right corner
- Bottom navigation: Home | Log | Farm | Leaderboard | Profile

11.2 Retro UI Guidelines

- Color palette: dark purple (#1A0A2E) background, neon pink (#E91E8C) accents, gold (#FFD700) for coins/streaks
- Typography: pixel font for numbers and headings, clean sans-serif for body text
- Animations: CRT scanline overlay (subtle), pixel transitions between screens
- Sound design: optional chiptune UI sounds (toggle in settings)
- Progress bars styled as retro health bars from old-school RPGs

 All pixel art and character sprites to be provided by the art team — use placeholder assets during development

MASTER PROMPT — Home Dashboard UI

Build the Home Dashboard screen for Piggy Bank Pet, a retro pixel-art budgeting app.

LAYOUT (top to bottom):

1. Top bar: App logo (left), Coin balance with pixel coin icon (center-right), Notification bell (right).
2. Greeting: 'Good [morning/afternoon/evening], [name]!' + today's date in pixel font.
3. PIG DISPLAY (hero section): Animated pig sprite in current state. Centered. Tappable for interaction animation. Below pig: food bowl fill meter + mood emoji.
4. BUDGET BARS: Two retro RPG-style health bars. Bar 1: Today (spent vs daily budget). Bar 2: This Month (spent vs monthly budget). Color: green → amber → red based on percentage.
5. QUICK ACTIONS: Two large pixel-art buttons side by side: [+ Log Expense] and [📷 Scan Receipt].
6. AI CHAT BAR: Text input with placeholder 'Tell me what you spent...' → sends to AI parser on submit.
7. RECENT TRANSACTIONS: Last 5 expenses in a card list. Each row: category icon | description | wallet tag | amount | time.

8. STREAK CARD: 🍷 [N] day streak — tappable to see history.

STYLE: Dark purple (#1A0A2E) bg, neon pink (#E91E8C) accents, gold (#FFD700) for coins/streak, pixel font for numbers.

Add subtle CRT scanline overlay (CSS repeating-linear-gradient or SVG filter) at ~5% opacity.

Bottom navigation: Home | Log | Farm | Board | Profile — pixel icons.

12. Future Considerations (To Evaluate)

Features flagged as 'maybe' — include in long-term roadmap

12.1 Open Finance API Integration

- Phase 2: Connect directly to Philippine bank accounts via BSP Open Finance framework
- Would allow automatic balance syncing without manual entry
- Requires financial-grade security compliance and BSP registration

 Do not build in Phase 1 — manual balance entry is sufficient for launch

12.2 Savings Goals Module

- Users create a savings goal (e.g., 'New Phone ₱25,000 by December')
- A portion of their daily savings is allocated toward the goal
- The goal has its own progress bar and milestone rewards
- Completing a goal unlocks a special cosmetic or pig breed

12.3 Spending Insights & Reports

- Weekly and monthly spending breakdown by category — pie chart / bar chart
- Compare this month vs. last month
- Average daily spend, highest spend day, biggest single expense
- Exportable as PDF or CSV

12.4 Bill Split

- Log a shared expense and split it with friends
- Each split portion becomes a debt record automatically
- Integration with the Debt Tracker

12.5 AI Financial Advisor

- Weekly AI-generated insights based on spending patterns
- e.g., 'You spent 40% more on food this week — try cooking 2 more meals at home'
- Powered by Claude or GPT with a personal finance specialist system prompt

 Requires careful handling — never give advice that could constitute regulated financial advice

13. Recommended Technical Architecture

Frontend	React Native (Expo) — single codebase for iOS & Android
State Management	Zustand or Redux Toolkit
Backend / Auth	Firebase (Firestore, Auth, Cloud Functions, FCM) or Supabase
OCR / Receipt Scan	Google ML Kit Vision (on-device, no API cost) — fallback: AWS Textract
AI Chat Logger	Claude Haiku or GPT-3.5-turbo via API (low cost per call)
Push Notifications	Firebase Cloud Messaging (FCM) — cross-platform
Offline Support	AsyncStorage + background sync queue
Analytics	PostHog or Mixpanel (privacy-friendly)
CI/CD	Expo EAS Build + GitHub Actions
Art Assets	Sprite sheets exported as PNG — Lottie for complex animations

14. Unified Master Prompt for AI Code Generation

Use this as your top-level prompt when starting a full build

Copy the prompt below as the system/initial prompt when using an AI code assistant (Cursor, Claude, Copilot Workspace, etc.) to scaffold the full application. Customize the bracketed fields before use.

PIGGY BANK PET — FULL BUILD MASTER PROMPT

You are building a mobile application called Piggy Bank Pet — a retro pixel-art budgeting app for the Philippine market. The app uses gamification through a virtual pig companion to encourage healthy financial habits.

TECH STACK: React Native (Expo), Firebase (Firestore + Auth + Cloud Functions + FCM), Google ML Kit for OCR, Claude Haiku API for AI chat logging.

CORE FEATURES TO BUILD:

1. Auth: Email, Google, Apple Sign-In. Cross-device sync via Firebase.
2. Multi-Wallet: E-Wallet, Bank, Cash accounts. Real-time balance updates.
3. Expense Logging: Manual form, Receipt OCR scanner, AI natural language parser.
4. Categories: Default set + custom. Tagging on every expense.
5. Budget Engine: Monthly budget + daily allocation. Surplus = pig food.
6. Pig State Machine: HAPPY/WORRIED/SAD/GRUMPY/SKINNY/GONE based on spending. State recalc nightly via cloud function.
7. Recurring Expenses: Templates with auto-logging via scheduled cloud functions.
8. Debt Tracker: Receivables and payables with partial payments, due date reminders.
9. Gamification: Coins, streaks, milestone rewards, Cosmetics Shop, Pig Farm.
10. Leaderboard: Friends system ranked by days under budget. No spending amounts shown.
11. Push Notifications: Daily logging reminder, budget warnings, pig state changes, streak alerts, debt due dates.

UI STYLE: Retro pixel-art. Dark purple (#1A0A2E) bg, neon pink (#E91E8C) accents, gold (#FFD700) for rewards. Pixel font for numbers. CRT scanline overlay. Pig sprites are placeholders until art assets are delivered.

DATA RULES: Pig state and leaderboard = server-authoritative. All sensitive data in Firestore with security rules. Offline-first: queue locally, sync on reconnect. Never expose actual spend amounts on leaderboard.

Start by scaffolding the project structure, then implement features in this order: Auth → Wallet → Expense Logging → Budget Engine → Pig State → Recurring → Debt → Gamification → Notifications → Social.
